

PrinterOn Embedded Agent for Samsung XOA MFPs/Printers – Version 2.01.005 Release Notes

PrinterOn Embedded Agents

PrinterOn Embedded Agents for Samsung printers are embedded software applications that enable simple plug and play printing for PrinterOn's Hosted or On-Premise solutions. They eliminate the requirement for customers to install any additional hardware or software component to be able to release the print jobs submitted to the PrinterOn Service. The PrinterOn Embedded Agent Software can be installed on a number of Samsung XOA device models allowing users to print seamlessly using any of the PrinterOn supported document submission methods.

The list of supported XOA models can be found here: <http://www.printeron.com/solutions/technology-partner-solutions/samsung.html>

The following features and enhancements have been included in this new version (2.01.009) of the PrinterOn Embedded Agent for Samsung XOA MFPs/Printers:

Product Features and Enhancements

- **NEW – Enhanced PrinterOn Enterprise On-Premise Support**

The PrinterOn Embedded Agent software now supports complete integration with PrinterOn Enterprise Server (On-Premise Edition) enabling you to fully exploit the On-Premise server device configuration management and reporting features.

Using the SyncThru Web Service tool on the MFPs, administrators can configure PrinterOn Embedded Agent to force all communication via the PrinterOn Enterprise (On-Premise) server, while retaining the flexibility of a plug and play deployment.

- **NEW – Secure Release Anywhere Support**

PrinterOn's Secure Release Anywhere offers pull print support for all PrinterOn solutions including PrinterOn Hosted (Public Cloud) as well as PrinterOn Enterprise (On-Premise) Edition. Secure Release Anywhere support allows users to submit jobs to a single print queue and release their jobs at any managed device.

Using the PrinterOn Embedded Agent, jobs can be easily and securely delivered not only within the single network, be also delivered efficiently across disparate networks, thereby providing the capabilities of a pull print solution with the flexibility of a simple plug and play global solution.

The PrinterOn Embedded Agent is capable of supporting automatic print and Secure Release Anywhere print release methods at the same time to the same printer

- **NEW – Authenticated Print User Release**

The PrinterOn Embedded Agent now allows print users to authenticate with their username and password to access and release print jobs. This feature is supported for both PrinterOn Hosted (Public Cloud) and PrinterOn Enterprise (On-Premise) Editions. Once the PON Server successfully authenticates the user, the Agent software securely retrieves only those jobs submitted by the user.

- **NEW – Print Job List Screen**

The PrinterOn Embedded Agent now provides print user user with the ability to view and select print jobs to release or delete. This feature allows the users to print only what they need thereby preventing wastage and saving print costs. The Job List screen also allows users to make multiple selections.

- **NEW – Embedded Print Router**

The PrinterOn Embedded agent can serve as a print job router for other printers or MFPs, which do not include the embedded software. By defining and linking multiple PrinterOn virtual printers to a single PrinterOn Embedded Agent, the administrator can configure network output destinations for each listing, allowing the embedded agent to redirect jobs to these printers once jobs have been downloaded locally to the print device

- **NEW – Local Storage and Compression Support**

This new version of PrinterOn Embedded Agent comes with the inbuilt capability to automatically pre-download and store print jobs locally on the print device in compressed format, if, and when they become available. This functionality significantly decreases the time to release print jobs, as jobs are pre-downloaded and saved on the disk.

- **NEW – Reprint Functionality**

The PrinterOn Embedded Agent now supports reprinting of print jobs up to five times for time duration of 20 minutes after the first time of release. Allowing the users to reprint is critical if a print job is unsuccessful due to printer errors.

- **ENHANCED – License/Connectivity Status**

The new version of PrinterOn Embedded Agent provides service administrators with more precise and accurate PrinterOn server connectivity and service license status.

- **ENHANCED – PrinterOn Look and Feel**

The application makes use of standard PrinterOn Icons and Logos giving it a familiar look. The Application UI interface has been tailored to suit PrinterOn's Service Integration requirements. The product has been renamed to PrinterOn.

- **IMPROVED – Troubleshooting Tools**

The Application Logging feature has been improved significantly to record all external transactions. This new version also allows support personnel to download all the log files in a single click.

- **FIXED – SecuThru Lite 2 Print Issue**

This new version fixes an issue whereby the jobs will fail to print if Samsung SecuThru Lite 2 software is installed on the same device.
