

PrinterOn Android Phone and Tablet Applications Release Notes

Version 1.0.5

Product Changes and Enhancements

PrinterOn Phone and Tablet Applications for Android offer an integrated solution for accessing both PrinterOn's global network of Public Print Locations and the PrinterOn Enterprise Platform in a single unified application. The PrinterOn Android applications simplify the process of discovering and printing to all PrinterOn's services.

The following are some of the improvements that have been made in this version of the software.

- **Fixed – User Account Information Storage and Retrieval**
Addressed an Android 4.2 OS compatibility issue which caused the PrinterOn Android applications to incorrectly retrieve user credential information on the device which resulted in print jobs failing to be accepted by the Enterprise server.
- **Fixed – Printing Contacts**
Addressed an issue introduced in Android 4.1 OS which prevented users from being able to select one or more contacts to print.
- **Improved – Privacy Release Code Configuration**
Addressed an issue that resulted in the application requiring users to enter the privacy release code when the release code configuration was set to 'optional' for a printer.
- **Fixed – Update Printer Information**
Addressed an issue which caused a printer details update operation to fail on the Android device for some configurations.
- **Improved – Show Password Option**
The 'Show Password' option in the Account Information Screen has been removed. This change increases the privacy of account information for devices that may be shared between users.
