

PrinterOn Mobile for iOS 3.5.6 - Release Notes

Version 3.5.6

PrinterOn Mobile for iOS offers an integrated solution for accessing both the PrinterOn Server Platform as well as PrinterOn's global network of Public Print locations in a single unified application. PrinterOn Mobile for iOS simplifies the process of discovering and printing to all PrinterOn's services.

PrinterOn Mobile for iOS supports iOS 8 or newer.

The following are some of the enhancements that have been made in this version of PrinterOn Mobile for iOS.

Product Changes and Enhancements:

- **New – Xerox Secure Print Compatibility (iOS-649)**
Users can now submit and store preferred Secure Print codes for Xerox devices when using the PrinterOn mobile apps. Support for Xerox Secure Print offers users and administrators the ability to provide the native Xerox secure release and tracking capability without any additional software installer.

Xerox Secure Print support allows the PrinterOn mobile app to recognize when a printer is configured to use Xerox Secure Print and prompts users to enter a compatible Xerox Secure Print code. Codes are stored on the client device and can be managed by the end user, allowing them to store their User Code for future print jobs.
- **New – Print History Cache Management (iOS-651)**
Introduced new cache management capabilities for print history data stored on the device. Users can now choose the amount of data stored, in MB, for print history. Users are offered to select between 50, 100, 250 and 500MB. Users are also offered the option to manually clear any data stored within the app.
- **Improved – LDAP/AD Credentials Validation (iOS-676)**
Improved the method by which user credentials are validated when using LDAP or Active Directory as the authentication method on the server. Credentials are now actively validated when entered by the user or when the user account is activated. Users are offered the option to change credentials or continue if validation fails.
- **Improved – QR Code Release Flow (iOS-684)**
Fixed an unnecessary step in the job release flow that required that users confirm their release print a second time when releasing jobs using a QR code. The updated flow allows the user to confirm and release their print jobs in a single step.
- **Fixed – Documents Browser Fails to Open on iPads (iOS-706)**
Addressed a compatibility issue reported on some iPads with iOS 9 or iOS 10 installed where documents could not be opened using the native Document Browser.

System Requirements

- iOS 8 or newer
- MDM integrated applications require a configured MDM server and provisioned device to work correctly.
